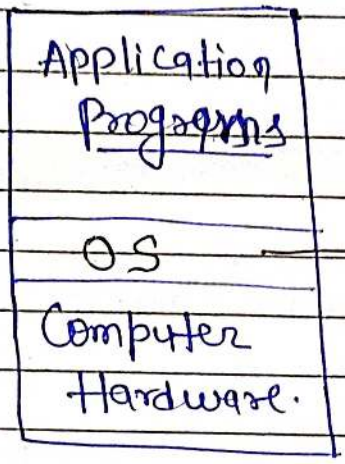
RANKA

I. Introduction and Background –



→ Operating System is also known as System Software.

→ It provides an Environment.

→ Processor executes the instructions of a Programs in a sequential manner.

2.2 GHz

2.2×10^9 Hz = 2.2×10^9 cycles/sec.

2.2×10^9 cycles ⟶ 1 sec.

1 cycles ⟶ $\frac{1}{2.2 \times 10^9}$ sec.

≅ ns

1 cyc ⇒ 1 micro instructions Execution.

Phases of Execution of instructions -

IF. – fetch

ID – Decode

OF – operand fetch

Execut. –

WB. –

MS – Secondary memory
MS – Main memory
RS – Registers

Date / /
Page

→ Program in Execution is known as a process.

→ Program → passive Entity → S. Memory
Process → Active Entity → M. Memory

- Types of operating System-

① Batch operating System
② Multiprogramming OS
③ Multitasking OS
④ Multiprocessor OS
⑤ Real time OS.

① Batch Operating System →

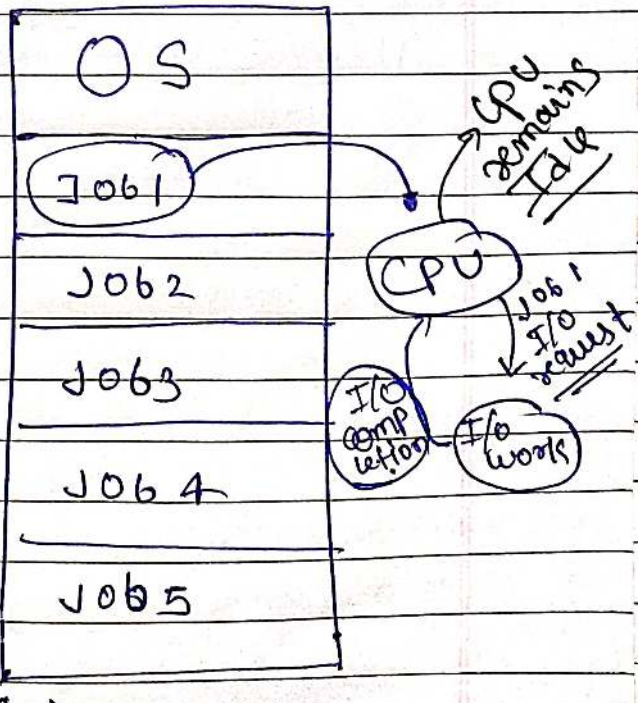
→ Efficiency = Total no. of jobs done / Total time taken.

→ Processor System → Unique Processor
→ Multiprocessor

ROM → Bootstrap Loader (NIC)

→ Similar types of Batch are punched at a time.

CPU + I/O work work



Main memory

Date / /
Page

RANKA

- System call -

→ It is a request made by the user program to get the service of an operating system.

```
int main()
{ int a, b, c;
  scanf("%d %d", &a, &b);
  c = a+b;
  printf("%d", c);
  return 0;
}
```

→ read()

→ write()

System call

→ Disadvantage

→ CPU remains Idle at the time of I/O work.

→ ~~only job of the~~

→ CPU performs only one job at a time then ~~it~~ only it can move to next job

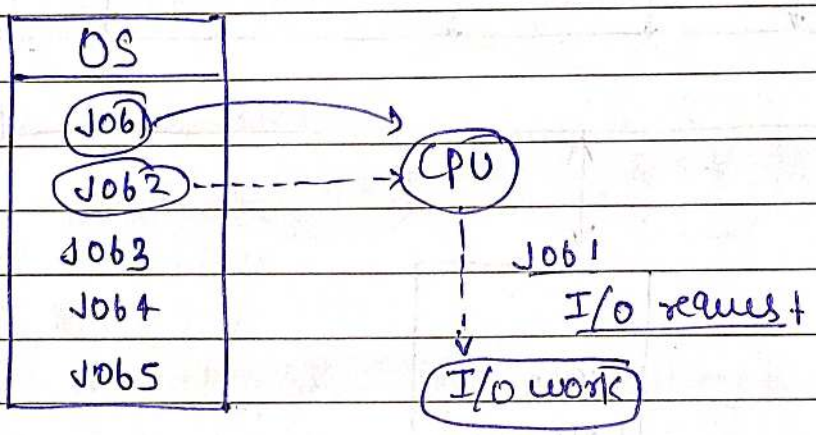
→ .

✡ Multiprogramming OS → (Unique Processor)

- **Degree of Multiprogramming →**

→ The number of programs residing in the main memory at any point of time is known as Degree of Multiprogramming.

→



→ Atleast 1 program is present in Main memory, the CPU can never be Idle.

→ In the

✡ Multitasking OS → (Unique processor)

→ It is an Extension of Multiprogramming OS.

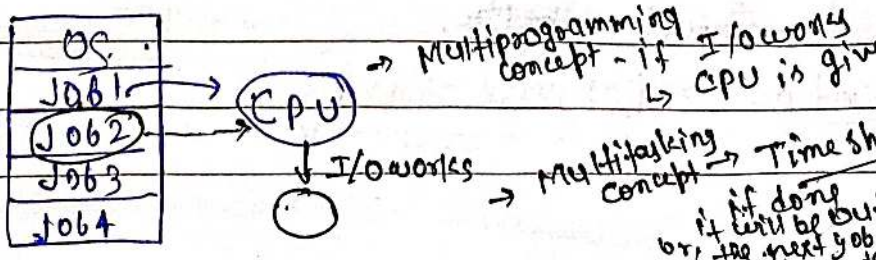
→ (Extend) keyword → Inheritance
↳ parent class property → Child class

→ Code reusablity - Everything of Multiprogramming is inherited to Multitasking.

→ CPU is shared b/w the programs in time Sharing manner.
(Time Quantum) (TQ) = 2ms. - e.g.

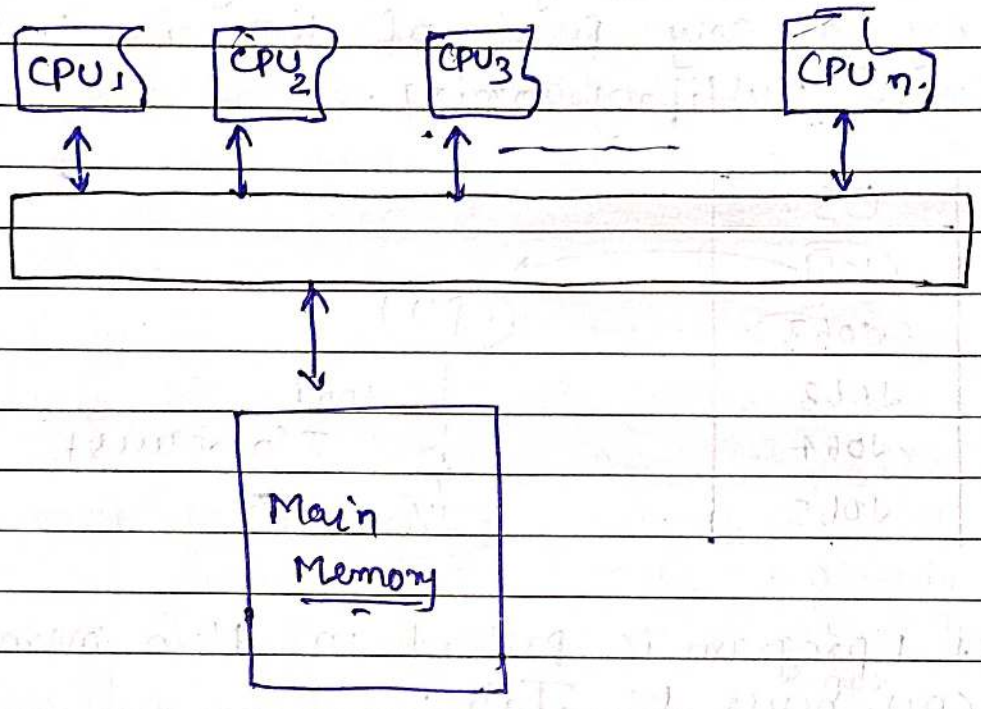
→ Switching is fast => So seems to be Multi program at one time.

→



→ Maximum duration of time a process can hold the CPU in Multitasking OS is Time Quantum.

✡ Multiprocessor OS -



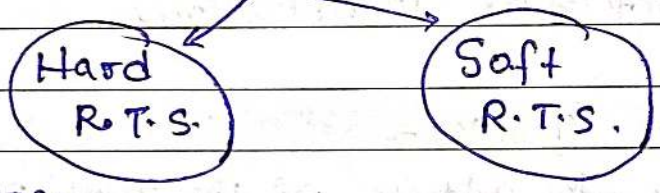
→ Multiple processor.
→ All other resources will be same
→ Resources will be shared with all these CPUs.
→ No. of jobs → distributed → Efficiency ↑
→ Advantage - Efficiency increased
→ fault tolerant — if one CPU gets fault, work trans. to other.
→ Disadvantage
↳ competition & contention in Accessing the Resources from Main memory.
→ Parallelism → Can be achieved.
↳ parallel work →
↳ Multiple process → Execution.
→ ~~Eco~~ Economical → ~~Costly~~.
→ Contention → Resource Sharing

→ 10 processor → Same time of work.
in 1 system
→ 10 System → Same time of work.

✡ Real time OS →

→ Realtime application → Strictly Time bounded System

Real time System



→ Missile Launching.

Hard R.T.S

↳ if 100 attempts, then 100 attempts must be Succeeded.

→ No, unsuccessfull is allowed.

Soft R.T.S

↳ 100 attempts, → 90 - Successfull. } If it's fine.
10 - Unsucessfull. }

→ Unsucessfull is allowed.

→ online Transaction OTP..

• Process Concepts →

Programs → Process

Sec. Mem. Primary Memory.

→ Processes → User Process
↳ ~~Sys~~

→ Process → ID assigned → PID → Process Identification number.
↳ number, with the help of this, OS identifies the Process. → Uniquely identify

Register → GPR - General purpose Register - $R_0, R_1 \dots R_n$
→ SR. - special Register
→ (PC), AC, MAR
IR, DR.

✡ Process - State Diagram -

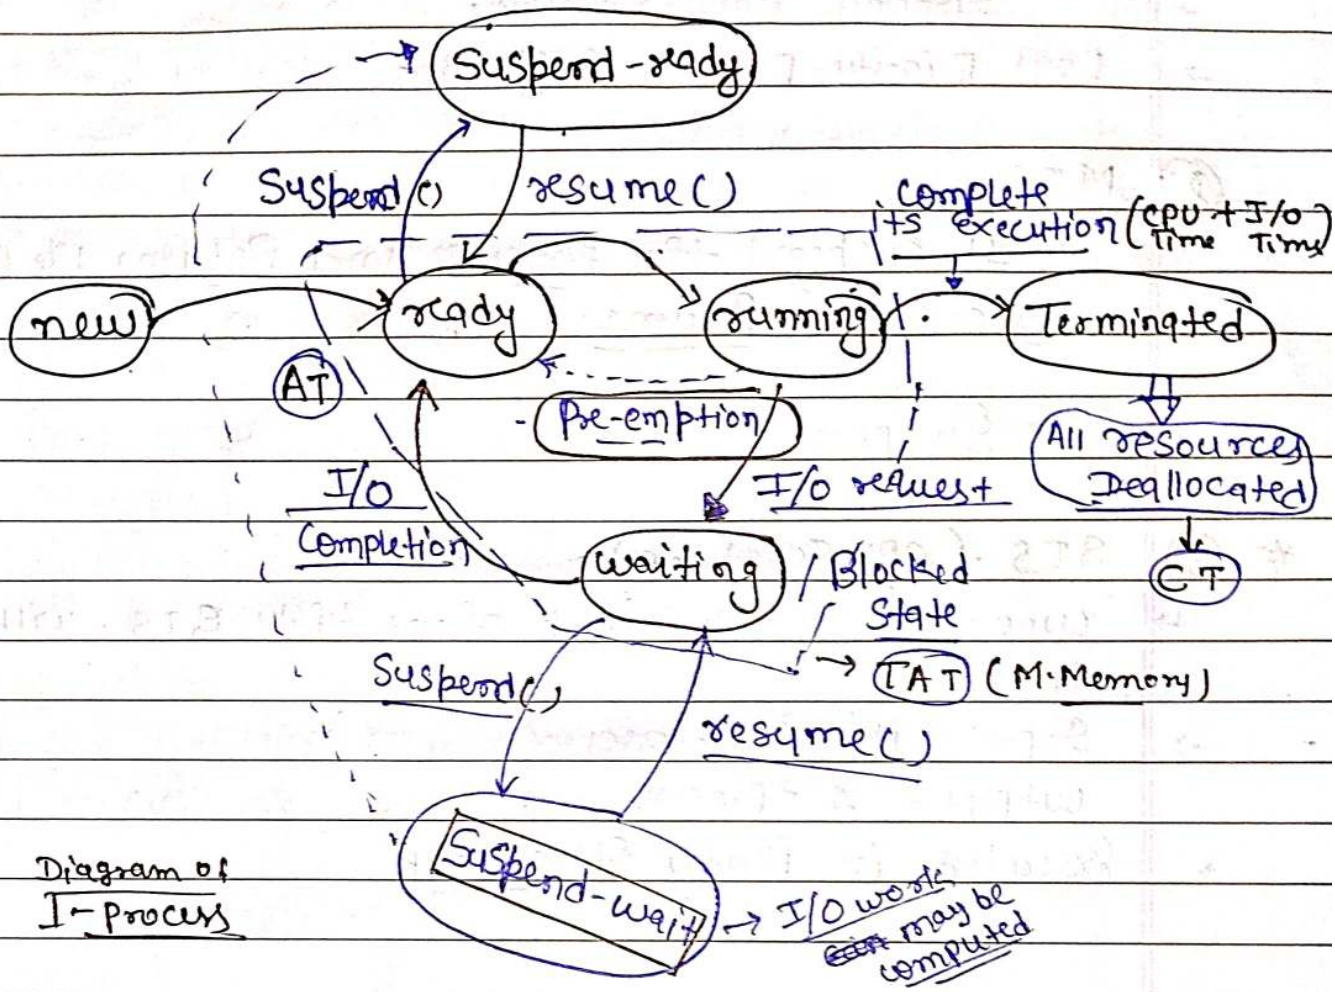

Diagram of I-Process

1. Long - term scheduler (LTS)
2. Mid - term Scheduler. (MTS)
3. Short - term Scheduler. (STS)

→ Sub-routine

? Or (CPU Scheduler)

→ They are the modules of the operating systems.
→ fixed program – Cannot be changed.

① LTS -

→ It will bring the program from the secondary Memory to Main memory.
→ Degree of Multiprogramming → (LTS) will alway increase the Degree of Multiprogramming.
→ Each time LTS, Executed, ~~new program will be~~

→ Memory Shortage.
→ ↳ Suspend some Processes.
→ Low Priority process suspended.

(2) MTS →
↳ It suspend the process and Resume the process
Suspend & Resume.

e.g - Swapper

* (3) STS (CPU Scheduler)
↳ Who will get the control of the CPU, STS will decide it.
→ Input - No. of processes.
Output - 1 - Process.
→ Executed in Ready State only

• Dispatcher -
↳ It Dispatches the CPU ~~shift~~ between the processes.
→ Provide CPU
→ Context Switching is also done by the Dispatcher.

Date / /
Page

- Execution Time -

Burst time = CPU Time + I/O Time

The ~~time~~ duration of time that is required by a process to complete its CPU work.

The duration of time that is required by a process to complete its I/O works.

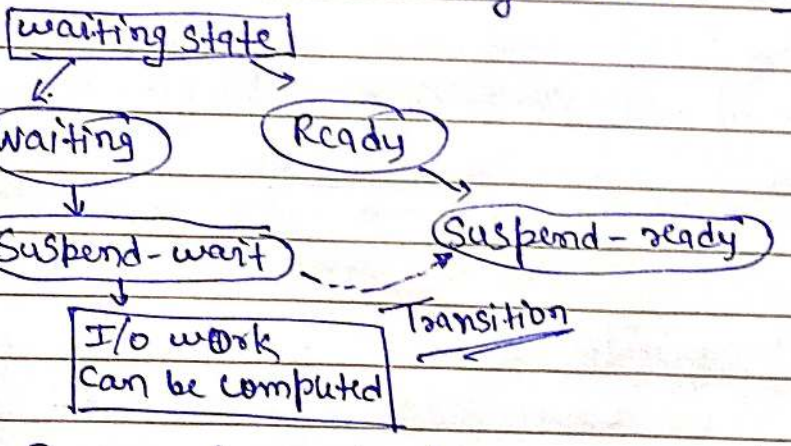
- Ready, waiting → waiting to get the control of the CPU is the waiting state.
  - waiting → for I/O work completion

- Pre-emption -

Pre-empt → because of some Priority.
↳ जबरदस्ती

Non-pre-empty → No-Priority

→ Process which is waiting will be Suspended.



→ If Process have to take CPU, it has to come to ready state to take control of CPU..

Date / /
Page

Q:- Consider there are n- processor in a System. and maximum m- Processes can be present in the System. What could be the minimum and maximum no. of Processes that could be present in the ready, Running and Waiting State.

	min	max
ready	0	m
running	0	n
Waiting	0	m

(n) - Proc.
n- Proces → Ready
m- Proc - Maxin

m = 10
n = 3

No. of Processors - Can restrict = Maximum processes in Running State.

Can't Say - Depends on the Size of Ram
↳ if maximum is not given.

Date / /
Page

- **Arrival time (AT)**

↳ The time when the process arrives in the ready queue is known as Arrival time of a process. - Exact time.

↳ Every process has its own arrival time.

- **Burst time (BT) (CPU Time)**

→ The amount of CPU time required by a process for its completion is known as Burst time of a process.

↳ Duration of time ~~for~~ for Execution of process.

- **Completion time (CT).**

→ The time when the process completes its Execution. is known as completion time of a process.

→ CPU work + I/O work - Time.

→ When I/O time is 0 (negligible), then Execution time is equal to Burst time.

- **Turn Around Time (TAT)**

↳ The time difference between the completion time & arrival time of a process is known as Turn around time of a process.

↳ i.e. $TAT = (CT - AT)$

↳ Time = Ready + Running + waiting.

- **waiting time - (WT)**

→ The time difference b/w T.A.T and Burst Time of a process is known as waiting time of a process.

i.e.

$$W.T = TAT - BT$$

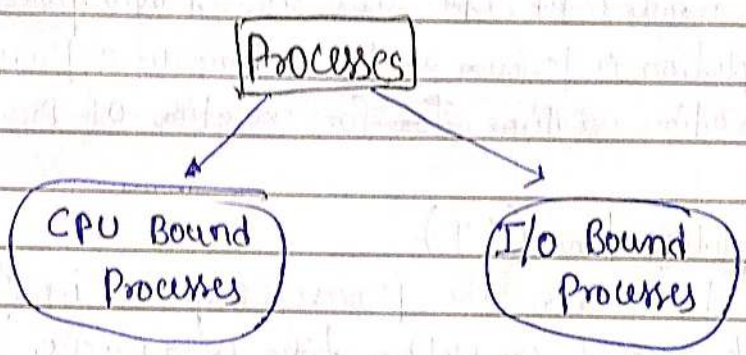
Ready + running + waiting — running

Date / /
Page

- **Response Time (RT)**

↳ The time difference b/w the 1st response and Arrival time of a process is known as Response Time of a process.

(1st response) means the time when the process gets the control of the CPU for the 1st time.

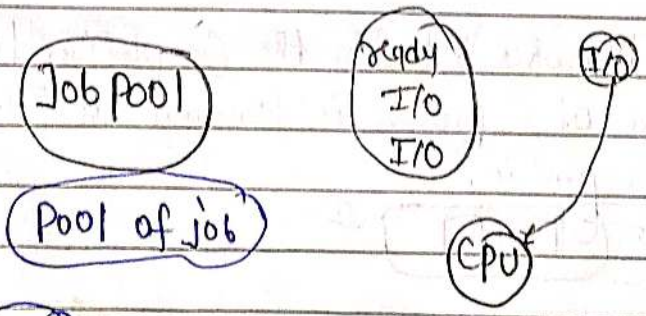


① **CPU Bound**

→ Those processes who spent more time doing the CPU work.

② **I/O Bound -**

→ Those processes who spent more time doing the I/O work.



(LTS) → Choose the process of I/O and CPU work both, for that Efficiency will be greater.

Date / /
Page

RANKA

- **Context Switching** –

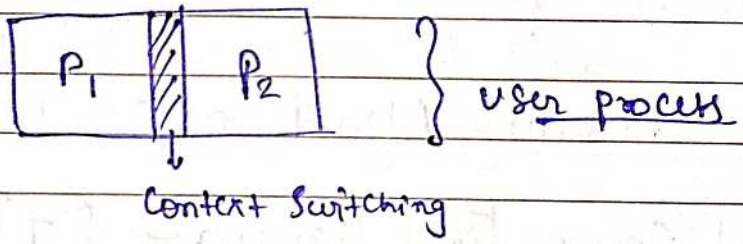
↳

P_1	P_2
~~running~~	~~ready~~
waiting	running

→ The control of the CPU is given to another process by context switching from one process to another.

→ whenever, there is context switching, Cremerally, two process will be involved in context switching.
- ↳ state change
- ↳ ~~At~~ changes in the Attributes.

↳ It is one type of (overhead) for the system.



```
CPU Scheduler ( )
{
   .
   .
   .
   dispatcher( );
}
```

```

- **Universal Assumption** – (To solve Synchronisation Problem)

→ The Running process can get preempted at any point of time after completing the current instruction / Micro instruction.

- **Moto** → **Consistency !**

21/09/22

→ Following three conditions should be satisfied simultaneously in order to achieve Synchronisation –

1. Mutual Exclusion
2. Progress
3. Bounded waiting

Program (P)

```
do{
    [Entry Section]
    [Critical Section]
    [Exit Section]
    [Remainder Section]
} while (true);
```

Note –

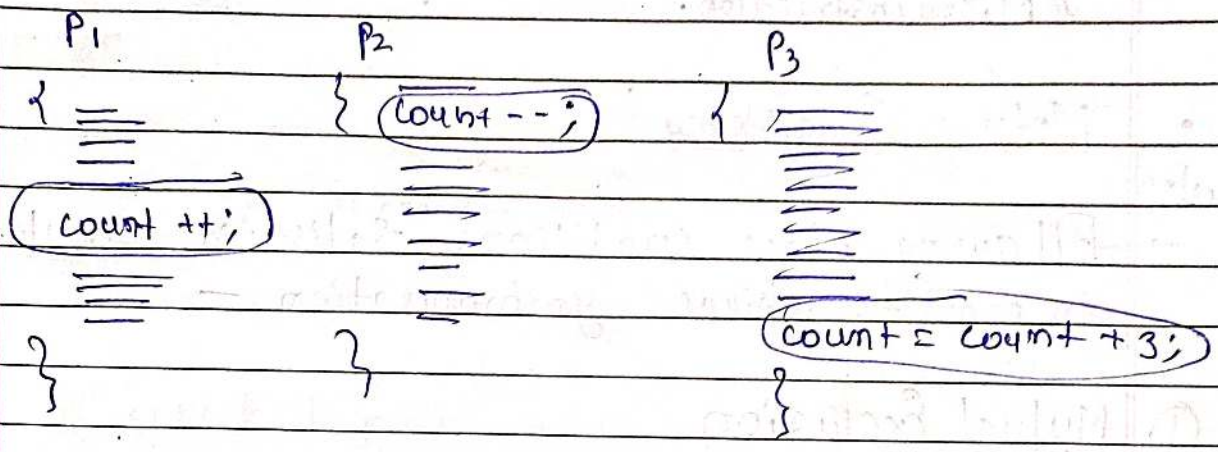
→ Any program can be divided in four sections – and critical is the most important one.

Date / /
Page

RANKA

- **Critical section -**

→ The portion of program text, where the shared variables are kept is known as Critical section.



- **Remainder section -**

→ The portion of program text, where independent variables are kept is called Remainder section.

✡ • **Mutual Exclusion -**

→ The process should Enter inside the critical section in a mutually Exclusive manner. That means No two process should be present simultaneously in the critical section.

✡ **Progress -**

→ The processes, those who are interested to enter inside its critical section, must be present in their respective Entry section. Among those processes, one of the process must be allowed to enter inside the critical section immediately, if the critical section is free.

Progress - leads to Deadlock

Date / /
Page

→ The decision that who will Enter inside the critical section should be taken by those Processes, who are Present in their respective Entry section and this decision should not be postponed indefinitely.

→ Not interested processes should not block the processes who are interested to enter inside the critical section.

✡ Bounded waiting →

→ There must Exist a bound on the no. of times that other processes are allowed Enter inside their Critical Section after a process has made a request to Enter inside its critical section and before its request is granted.

e.g -

P_i — flag = 1 → interested

```

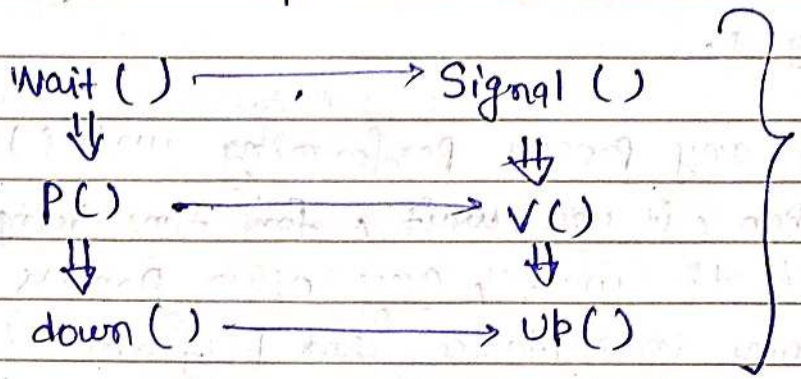
☆ Semaphore - (User-defined Data-type)

→ Semaphore is an integer variable that apart from initialization is accessed through atomic operations, i.e. wait() and signal().

Atomic - indivisible - Preemption not possible.



⇒ wait (S);

S → Semaphore

```
{ while (S ≤ 0);
  } S--;
```

⇒ Signal (S);

```
{ S++;
  }
```

⇒ if the value of Semaphore is less than or equal to zero, the process which is performing wait() operation ~~may~~ will wait until the value of Semaphore get changed to greater than zero.

→ Value will be changed by - either, signal operation is performed on the same semaphore, by ~~the~~ any other process. ~~is performing Signal op. on the same Semaphore~~. Or, the value gets changed to positive value.

Busy waiting

Date / /
Page

→ If any process is in wait condition, it may wait, but Signal & operation will never wait.

→ If any process performing wait() on any semaphore, the value of the semaphore will be decremented by 1. and, if any process performing signal() on any semaphore, the value of the semaphore will be incremented by 1.

→ If any process performing wait() on any semaphore then, it will wait, for this busy, for getting of the wait(), any other process, must have to come in either one wait or signal() on the same semaphore.

- Semaphore →

→ Binary Semaphore

{ 0, 1 }

only

Counting Semaphore

(−∞ to ∞)

any integer

- Define - Semaphore -

typedef short Semaphore
{ int value;
short Process *L;
};

Date / /

- Producer Consumer Problem with the help of Semaphore -

```
Semaphore Mutex = 1;
Semaphore Empty = N;
Semaphore Full = 0;

Void Producer()
{ int itemp;
  itemp = Producer();
  wait (Empty);
  wait (mutex);
  Buffer [in] = itemp;
  in = (in+1) mod N;
  Signal (mutex);
  Signal (Full);
}

Void Consumer()
{ int itemc;
  wait (Full);
  wait (Mutex);
  itemc = Buffer[out];
  out = (out+1) mod N;
  Signal (Mutex);
  Signal (Empty);
  consume (itemc);
}
```

⇒ Mutex is a binary / semaphore that will be used by the Producer & Consumer to access the Buffer in a Mutually Exclusive manner.

⇒ Empty is a counting semaphore that will keep track of the no. of Empty slots inside the Buffer at any Point of time.

⇒ Full is a counting Semaphore that will keep track of the no. of filled slots inside the Buffer at any point of time.

Hw Scheduling qn Synchronisation qn

fork() system call →

→ fork() is a system call, with the help of which, a new process is created.
→ It returns, positive integer (PID of the child process) to the parent process.
→ It returns 0 to the child process.
→ It returns -ve integer if, child, creation is unsuccessful.

e.g. →

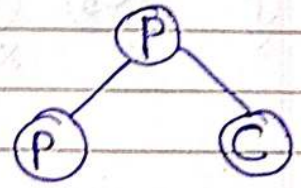
fork implementation -

```
fork() int main()
{ int pid;
  pid = fork(); child creation
  if (pid > 0)
  { printf ("I am parent process");
  }
  else if (pid == 0)
  { printf ("I am a child process");
  }
  else
  { printf ("child creation is unsuccessful");
  }
  return 0;
}
```

output -

(2)(1) → I am parent process
(1)(2) → I am child process

vice versa as per CPU allocation



→ Both the parent and the child will have the same code.
→ The child and the parent will have different physical addresses, but they will have same virtual addresses.

Monitor -

→ Monitor is a programming language that compiler supports to achieve Synchronisation.

→ It is collection of variables, condition variables & Procedures combined together in a special kind of Package known as Monitor.

→ The most important property of the Monitor is that only one process will be active inside the Monitor at any point of time.

monitor Example

Keyword

```
{
    Variables;
    Condition variables;
    Procedure P1
    {
    }
    Procedure P2
    {
    }
}
```

wait() and signal()

Condition x, y;

x.wait() or, wait(x)

y.wait() wait(y)

x.signal()

y.signal()

wait() – Condition varible –

↳ Suspend the ~~variable~~ process and put it in Block Queue of condition variable

Signal() – Condition variable –

↳ if the Block queue is Empty, signal will do nothing It will be lost.

↳ and if the Block queue is not Empty, signal() will wake up or resume any one of the process.

⇨ monitor Producer-Consumer.

```
{ Integer count;
  Condition Full, Empty;
  Procedure Enter_Item
  { if (count == N) wait (Full);
    Enter the item;
    Count = count + 1;
    if (count == 1) Signal (Empty);
  }

  Procedure Remove_Item
  { if (count == 0) wait (Empty);
    Remove the item;
    count = count - 1;
    if (count == N-1) Signal (Full);
    ~~Signal (Full);~~
  }
}
```

Date / /
Page

~~Procedure~~

```
Procedure producer.
{
    while (true)
    { produce = item(itemp);
    producer : Consumer . Enter_Item";
    }
}

Procedure Consumer
{   while (true)
    {   Producer : Consumer . Remove_Item;
        Process_item (item());
    }
}
```

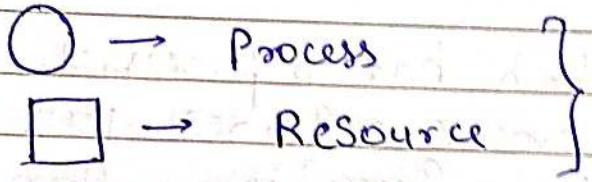
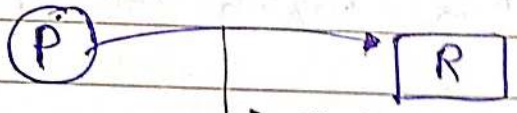
Deadlocks →

→ When two or more than two Processes are waiting for an event to happen, but that event never happens then, we say that these processes are involved in a Deadlocks.

- Conventions -



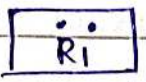
RAG



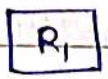
Requesting edge

Allocating edge

→ 3 instances of R_1 (Resource) is available currently to the system.



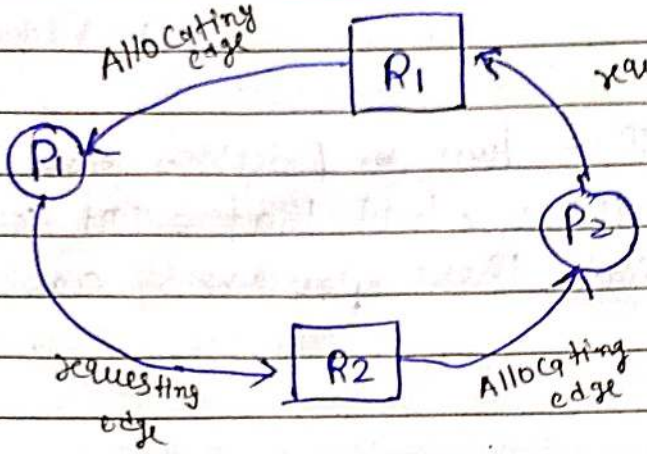
→ 2 instances of R_1 is available.



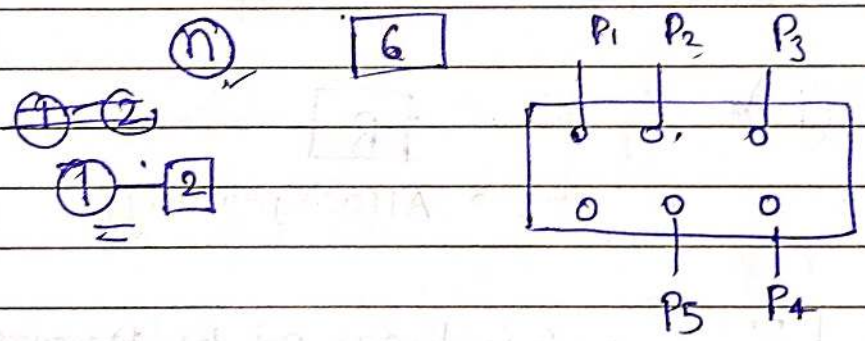
→ only one instance of Resource is available to the System.

- Requesting edge → Process is requesting to the resource and the Resource has not been Allocated.

- Allocating edge → Process has requested to the resource and the Resource has been Allocated.



Q. Consider a system which has n processes and six tape rights. each process requires two tape rights to complete their Execution, then what is the maximum value of n which ensure, deadlock free operation.



⇒ 5.

Q. Consider a system, which has three processes and each Process requires, two resources, to complete their execution what is the minimum no. of resource required ~~for~~ to ensure Deadlock free operation.

3-P.

P1 - (2) 2-1 - 1
P2 - (2) - 1
P3 - (2) - 1

(1) extra

Minimum = (4)

Q. Consider a System, which has three processes, P_1, P_2, & P_3. The peak demand of ~~each~~ process, P_1, P_2 & P_3 are, 5, 9, 13 respectively. What is the minimum no. of resources required to ensure deadlock free operation

P_1	P_2	P_3	
5	9	13	
4	8	12	+ 1

(25)

Q. (37) P_1 ---- P_n share m identical resource. reserved and released ~~at~~ one at a time.

Max = $P_i = S_p$ where $S_i > 0$.

$P_i max = S_p$

P.N. P_1, P_2, P_3 ---------- P_n.

Max^m demand S_1 S_2 S_3 ... S_n.

$m > (S_1-1)+(S_2-1)+(S_3-1)+ \ldots +(S_n-1)$

$m > (S_1+S_2+S_3+S_4 \ldots +S_n) - n$

$\Rightarrow (m+n) > \sum_{i=1}^{n} S_i$

(m+n) → min no. of resources

n → Max. no. of

$\sum_{i=1}^{n} S_i$ → Max^m demand

Deadlock — Resource oriented
Synchronization — variable oriented

Date / /
Page

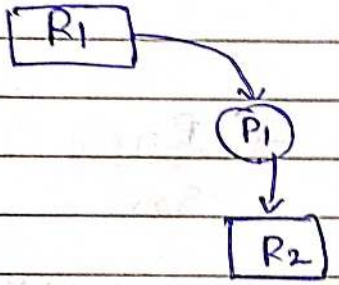
Deadlock characteristics :-

1. Mutual Exclusion
2. Hold & wait
3. Non-preemption
4. Circular-weight.

Mutual Exclusion

→ one resource at a time.

Hold & wait-



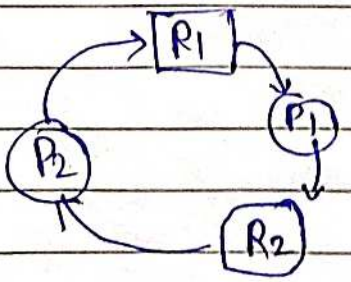
→ P_1 is holding the resource R_1 & requested for the Resource R_2 to be allocated.

Non-premption

→ No Premption.

Circular weight -

→ It doesn't guarantee about Deadlock.



→ Each of the above characteristics is a necessary condition for a Deadlock to occur. but not a Sufficient condition ~~to occur~~. for a deadlocks to occur.

→ Deadlocks है तो → Mutual Exclusion होगा ही. लेकिन कहीं Mutual Exclusion है तो Deadlock होगा है ये कहना ❌ गलत है।

→ The necessary and sufficient conditions for a deadlocks to occur is that the following four situations should be satisfied Simultaneously.
(a) ME (b) H & w (c) Non-Prem. (d) C.W.

→ चारों का एक साथ satisfy होना - Deadlock की गारंटी है। अगर कोई एक भी नहीं है तो हो भी सकता है, नहीं भी।

(1) Deadlocks prevention
(2) Deadlocks Avoidance
(3) Deadlocks Detection
(4) Deadlocks Recovery

(1) Deadlocks prevention ⇒

Disatisfy - any one of 4 characteristics

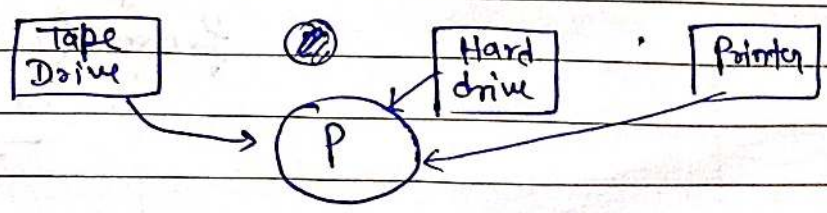
(a) M.E → It can't be dissatisfied

Resources → Non-Sharable to Sharable - then dissatisfied
→ Non-Sharable - Strictly then can't be dissatisfied.

(b) Hold & wait.

2- scenarios to disatisfy

(1)



In this scenario, we will provide all the Resources required by the process at the time of Process Execution. So, there will be no Hold & wait.

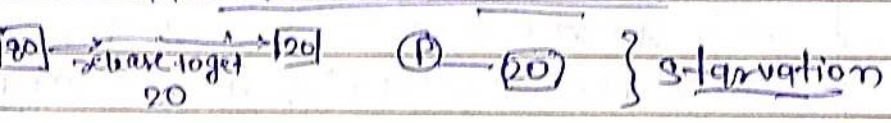
Disadvantage

=> Poor Resource Utilization
(Low)

- Scenario - 2

-> In this scenario, ~~we will~~ if any process has requested for the resource, then it has to release all the resources it has been allocated, so, there will be no Hold & wait.

Disadvantage - Suffer from Starvation



(c) Non-preemption ->

Suppose, P_1 has made a request for the Resource R_1

R_1 is available
↓
allocate it to P_1 immediately

R_1 is not available
↓
R_1 has been acquired by some other process say P_2.

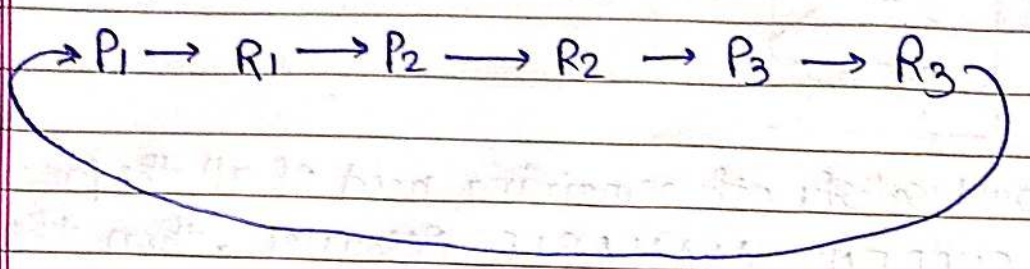
P_2 is in Execution
↓
Make P_1 to wait

P_2 is waiting for some other resource say R_2
↓
Preempt Resource R_1 from P_2 and allocate it to P_1

Date / /
Page

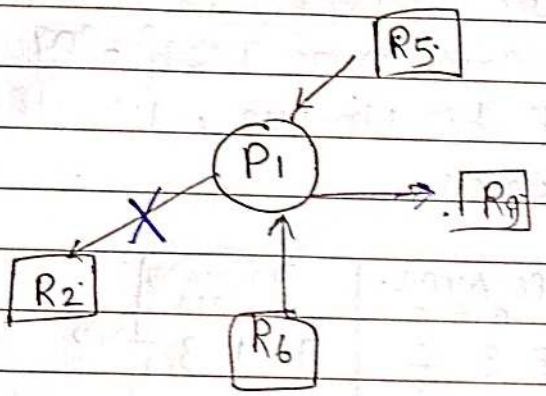
RANKA

(d) Circular wait -



→ Number all the Resources in System.

→ Process can make a request for the resources only in the increasing order of Enumeration. — Restriction



✡ Deadlock Avoidance - (Banker's Algorithm)

	Max NEED			Current ALLOCation			CURRENT AVAILABLE			Remaining Need

Q. Consider a system which has 256 M-words and each word is having the size of 64 bits. What is the capacity of main memory in Bytes.

256 M w
$2^8 \times 2^{20}$ words
2^{28} words

1 word = 64 bits

$2^{28} \times 64$ bits
$2^{28} \times 2^6$
$\Rightarrow 2^{34}$ bits

1 B = 8 bits
64 bits
8 B

$2^{28} \times 8$ B
$2^{28} \times 2^3$ B
$= 2^{31}$ B
$= 2 \times 2^{30}$ B
$\Rightarrow$ 2 GB

Q Consider a system which has 64 K words, and each word is having the size of 16 Bytes, what is the capacity of main mem- in Bytes

64 K w
$2^6 \times 2^{10}$ w
2^{16} w
$2^{16} \times 16$ B
$2^{16} \times 2^4$ B
$= 2^{20}$ B
$\Rightarrow$ 1 MB

1 w = 16 B

Q. Consider a system, where 32 binary bits are used to represents all the words of M.M., each word is having the size of 32 bits what is capacity of M.M. in Bytes.

32 bits W
$2^5 \times 2^5 = 2^{10}$
4 B x

1 w = 32 bits
4 B

1 B = 8 bit

No. of words = 2^{32} w 32 bits - all words

2^{32} words 2^{32} - total words

$\Rightarrow 2^{32} \times 4\,B$

$\Rightarrow 2^{32} \times 2^2\,B$

$\Rightarrow 2^{34}\,B$

$\Rightarrow 2^{30} \times 2^4\,B$

$\Rightarrow$ 16 GB

✡ RAM-Chip Implementation –

Q. Ram chip size = 128 B
organise the memory of capacity 16 KB.

(1) Calculate the RAM chips required ?
(2) organise the memory
(3) Size of Decoder = ?

→ = Size of the Memory required / RAM Chip size

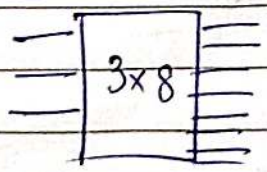
$= \frac{16\,KB}{128\,B} = \frac{16\,K \times B}{128 \times B} = \frac{2^{14} \cdot B}{2^7 \cdot B}$

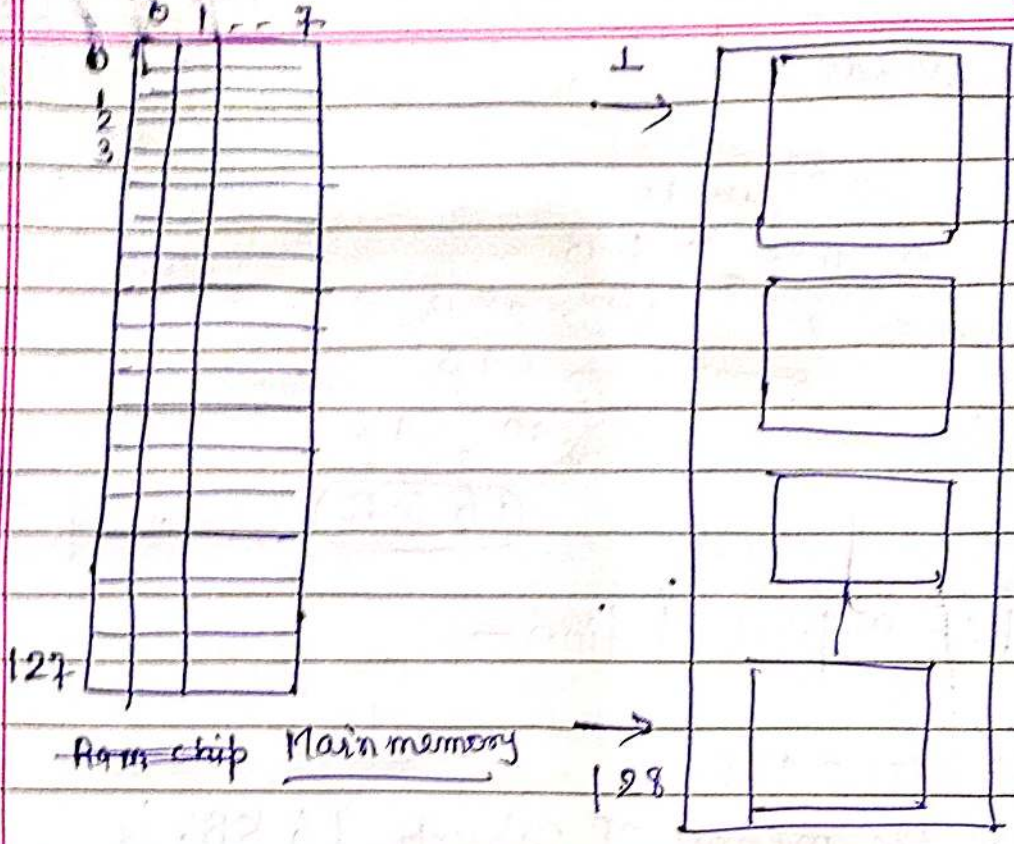
$= 2^7 \times 1$ (2^7 = 128)

Row Column

→ Decoder is used to select a row.

7×2^7
row
$n - 2^n$





Q. Ram chip size = 256 × 1 bit
Organise the memory of capacity 32 MB.

Q. Ram chip size = 512 × 2 bit
Organise the memory of capacity 64 GB

(1) Ram chip size = 256 × 1 bit
32 MB – organize

no. of Ram chips required $= \frac{32\,MB}{256 \times 1\,bit} = \frac{32M \times 1B}{256 \times 1\,bit}$

$= \frac{32M \times 8\,bit}{256 \times 1\,bit}$

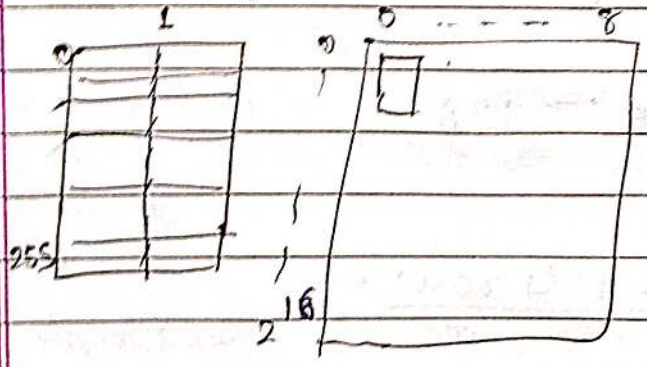
$\Rightarrow \frac{2^5 M \times 8}{2^8 \times 1}$

$\Rightarrow \frac{1}{2^3} M \times 8$

$\Rightarrow 2^{20} \times 2^{-3} \times 8$

$\Rightarrow 2^{17} \times 8$

$\Rightarrow 2^{20} =$



20×2^{20}

Date / /
Page

RANKA

(2) Ram chip size = 512 × 2 bit

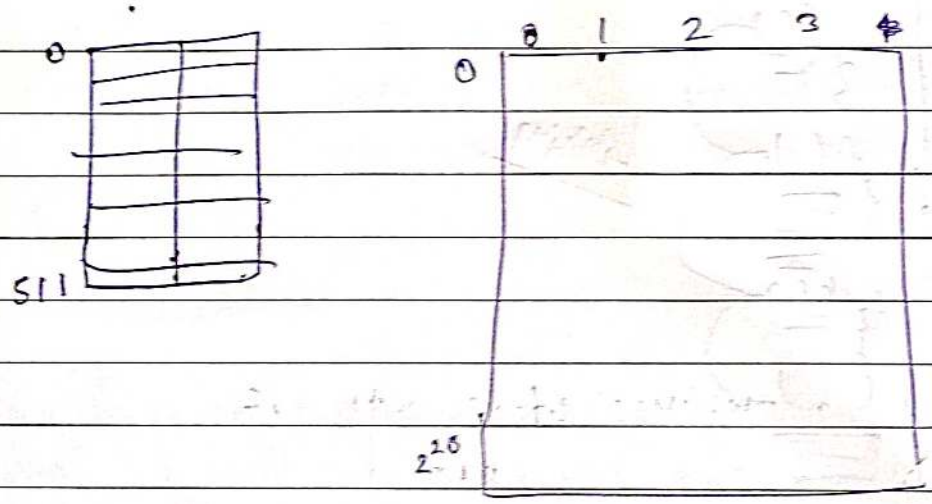
organise = 64 GB

No. of RAM chips required = $\frac{64\text{ GB}}{512 \times 2\text{ bit}} = \frac{64\text{ G} \times 1\text{ B}}{512 \times 2\text{ bit}} = \frac{64\text{ G} \times 8\text{ bit}}{512 \times 2\text{ bit}}$

$= \frac{2^6 \times 2^{30} \times 4}{2^9}$

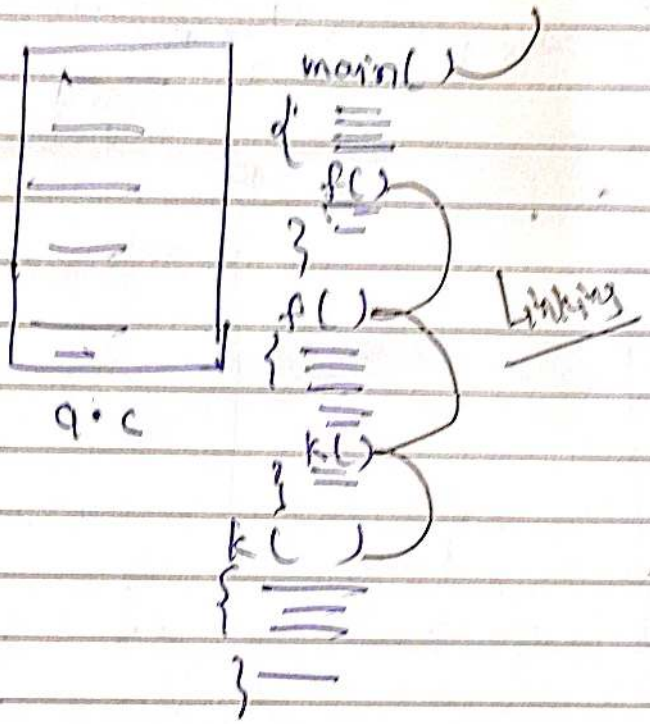
$\Rightarrow 2^{36-9} \times 4 = \frac{2^{27}}{} \times 4$

$= 2^{29} \Rightarrow$ (29 × 2^{29})



Loading, Linking and Address Binding

Loading - Loading of the modules & programmes from Secondary memory to the Main memory.
→ Loading is done by Loader. (part of OS)



Static Loading

→ Program Execution will be faster, due to -
→ copy of all the programmes to the Main memory before its Execution.

Advantage - (Execution time = Less)
→ Execution time ~~= Slow~~ ↳ fast Execution

Disadvantage -
→ not the efficient utilization of the Main memory.

Dynamic Loading

→ Program Execution will be slower due to -
→ Copy of only the necessary part of programmes, to the Main memory, and if required then Access the secondary Memory for requirement.

Advantage →
→ Efficient utilization of Main memory

Disadvantage -
↳ Execution time - ~~slow~~ High
↳ Time taking ~~(~~)

Date / /
Page

RANKA

☆ Linking -

→ Establishing the link b/w all the modules of a programs is known as Linking.

→ Linking is done by the ~~the~~ Linker. (part of OS)

☆ Address Binding : -

→ Association of programmes, Instructions and data to the actual physical memory. is known as Address Binding

→ There are ~~three~~ types of address Binding -

1. Compile time address Binding. — Compiler
2. Load-time address Binding — Loader
3. Execution time address Binding — Processor

→ Reallocation

↳ The address binding will be postponed even after Loading the program into the Main memory.

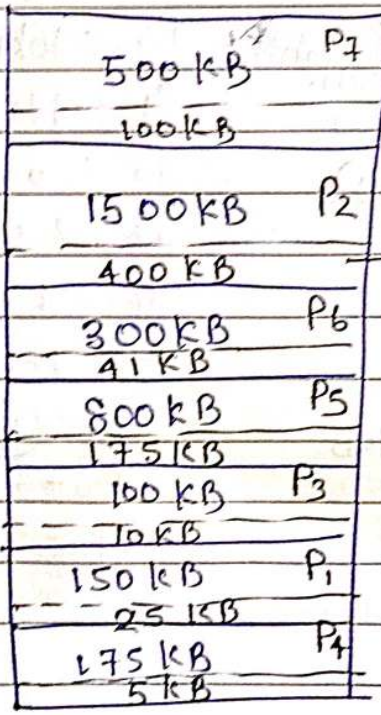
↳ The address binding will be done by the processor at the time of program Execution.

Date / /
Page

Memory management techniques →

- Contiguous Memory Allocation
  - fixed partition scheme
  - variable partition scheme
- Non-Contiguous Memory Alloc[n]
  - Paging
  - Multi-level paging
  - Inverted paging
  - Segmentation
  - Segmented paging

① fixed partition scheme →



- Main memory

→ lower limit register → starting address of that partition
→ higher limit register → ending address of that partition

internal fragmentation

$P_1 \rightarrow 125$ KB
$P_2 \rightarrow 1100$ KB
$P_3 \rightarrow 90$ KB
$P_4 = 170$ KB
$P_5 = 625$ KB
$P_6 = 259$ KB
$P_7 = 400$ KB
$P_8 = 110$ KB

→ No. of partitions is fixed.
→ The size of partition can vary.
→ In one partition, only one program can Execute.
→ Degree of Multiprogramming is restricted.

3525 KB

756

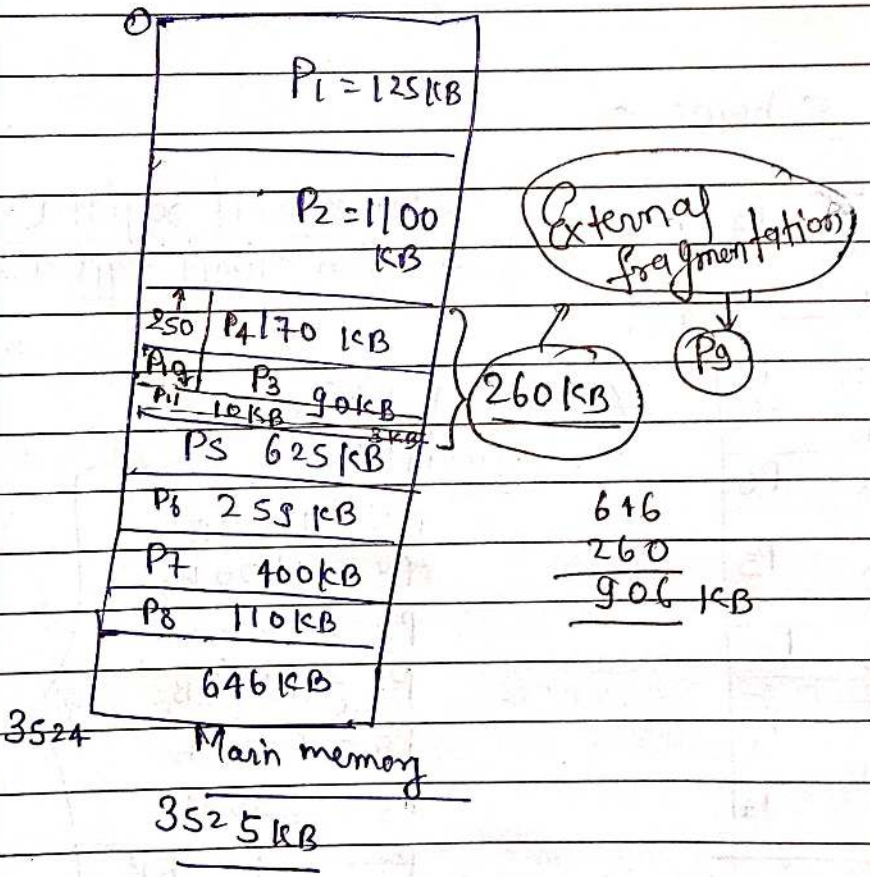
Date / /
Page

RANKA

→ Static loading
→ The size of program Executed is restricted due to size of partition

(2) Variable Partition Scheme :-

→ Initially, Main memory, will be one single contiguous Block of the fixed size of memory.



P1 → 125KB
P2 → 1100KB
P3 = 90kB
P4 = 170kB
P5 = 625KB
P6 = 259 KB
P7 = 400KB
P8 = 110SB
P9 = 700 KB
P10 = 250
P11 = 7KB

→ ~~No~~ Internal fragmentation Can't be ~~possi~~ implemented in variable partition scheme
→ External fragmentation Can't be implemented in fixed partition scheme.

Date / /
Page

RANKA

- Solution to Remove External fragmentation -

① Compaction → By Realloacting the memory.

→ Practically, it is very difficult to implement
→ Running Process gets interrupted here.

② Non-Contigous Memory Allocation -

✱ Partition Allocation methods :-

① first fit
② Best fit
③ worst fit
④ Next fit — circular

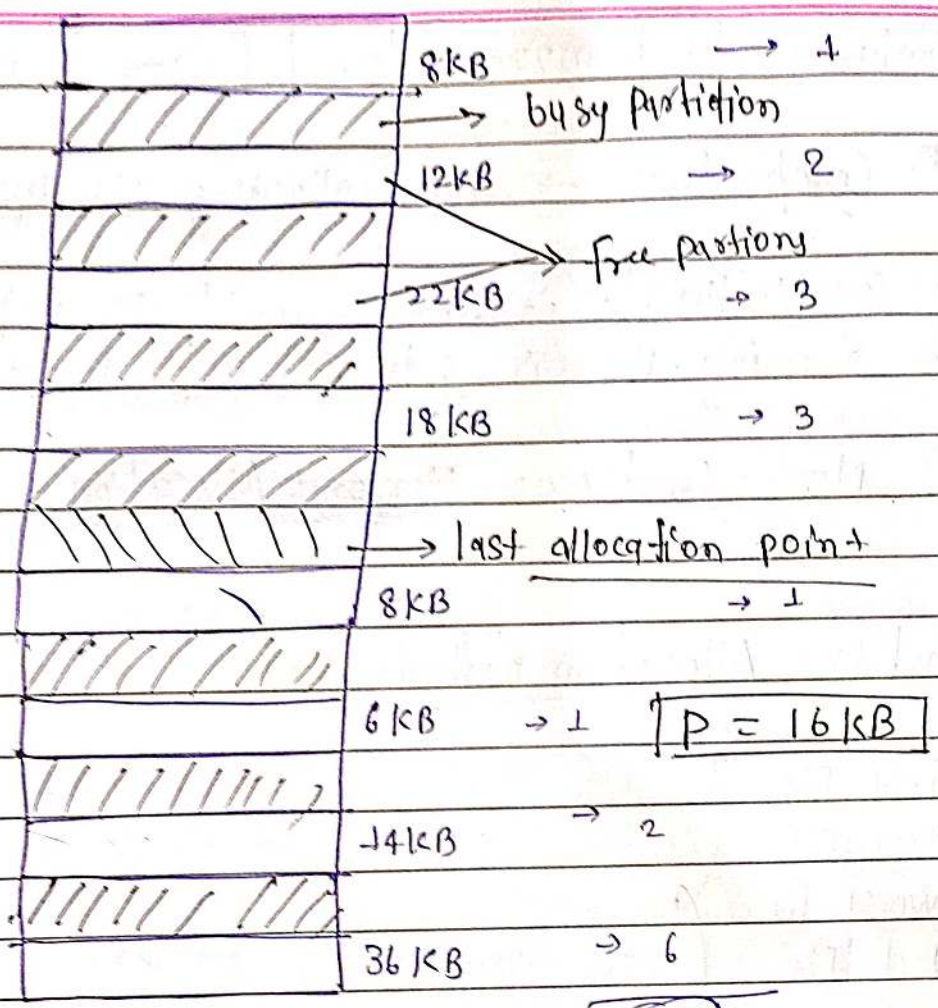
① first fit -
→ Allocate the process, in the first, sufficient partition, from the top of the memory.

② Best fit →
→ Allocate the process in the partition, which is the smallest sufficient partition, from all the available partition.

③ worst fit →
→ Allocate the Process in the partition, which is the largest sufficient Partition, Among all the available / free Partitions.

④ Next fit → Next fit also works like the first fit, but ~~next~~ the searching will start from last allocation point.

Q.



M·M

(19)

first = 22kb
best = 18kb
worst = 36kb
next = 36KB

Q. How many successive request of 6KB could be satisfied assuming variable partition scheme.

P = (6KB) ⟶ (19) request could be satisfied

By default it → Byte addressed

→ Paging is a technique of processor generated Logical address to physical address.
→ LAS is divided in fixed sized part.

→ The technique of mapping processor generated, logical address to physical address is known as Paging.
→ Important points on paging :-
→ LAS is divided into fixed size partitions ; which is known as "Pages".
→ PAS is divided into fixed size partitions , which is known as "frames"
→ Page size is always equal to frame size.
→ When the paging is applied, a page table will be created
→ The no. of Entries, in the page table is equal to no. of pages in LAS.
→ Page table entry will definitely contain a frame no.
→ • No. of pages in LAS = $\frac{\text{LAS}}{\text{page size}}$

• No. of frames in PAS = $\frac{\text{PAS}}{\text{frame size}}$

• Page Table Size = No. of Pages in LAS * Page Table Entry Size

⇓ to store frame no.
bits required

⇒ no. of Pagetable Entry = no. of pages

→ whenever the process is created, the paging will be applied on the process, and then the page table will be created.

→ The Base address of the page table will be stored in the "PCB".

→ The paging is with respect to, Every process, and Every process, will have its own page table.

→ The page table of the processes will be stored in the Main memory.

Q. Consider a system, which has Logical address of 27 bits and physical address of 21 bits, Page size = 4K word. Calculate no. of pages & no. of frames.

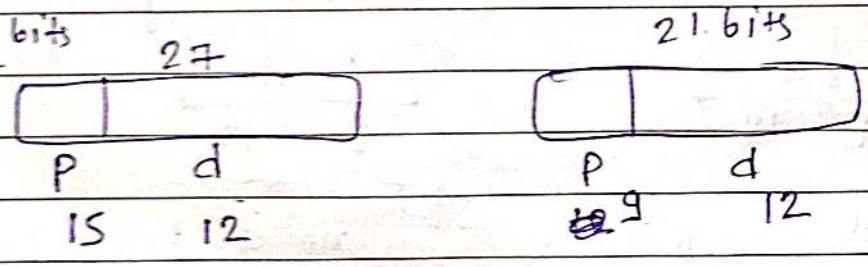
LA = 27 bits = 2^{27} word

PA = 21 bits = 2^{21}

Page size = 4K word.

No. of Pages = $\frac{2^{27} \text{ word}}{4 \times 2^{10} \text{ w}} \Rightarrow 2^{27-12} \Rightarrow 2^{15}$

No. of frames = $\frac{2^{21} \text{ word}}{4 \times 2^{10} \text{ w}} \rightarrow 2^{21-12} \Rightarrow 2^{9}$



Date / /
Page

8. Consider a system, where, no. of pages = 2K. & Page size = 4KW. Physical Address = 18 bits Calculate, LA & No. of frames in PAS.

~~no of pages~~ = 2K

no. of pagy = $2 \times 2^{10} = 2^{11}$

Page size = 4KW.

$= 2^{12}$ w

d = 12

P = 11

$\Rightarrow$ d+P = 23

PA = 18 bits

$= 2^{23}$

PAS = 2^{18}

LAS = no. of pagy x pages

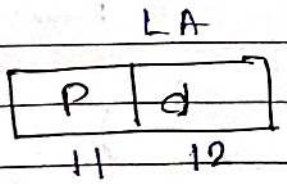
$\Rightarrow 2^{11} \times 2^{12}$

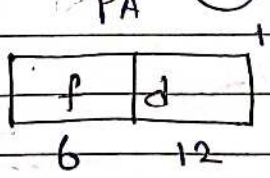
$= 2^{23}$ w = 23.

LA = 23 bits

~~Page table~~ Size = No. of frames = $\frac{2^{18} w}{2^{12} w}$

$\Rightarrow 2^6$





2K = 2^{11}

LA = 23

no. of frames = 2^6

Date / /
Page

Q. Consider a system, which has LAS, of 128 MW and PA = 24 bits. PAS is divided into 8 K frames what is page size and howe many pages are there in LAS.

PAS = 8 K

no. of frams $= 2^3 \times 2^{10} = 2^{13}$ frams

~~213 pages~~

Page size = ?

PA = 24 bits $PAS = 2^{24} w$ $\Rightarrow 2^{13} = \frac{2^{24}}{\text{frame size}}$

LAS = $128 \times 2^{20} w$ $\Rightarrow$ page size $= 2^{24-13}$

$\Rightarrow 2^{27} w$. frame size $= 2^{11} w$

no. of pages $= \frac{2^{27} w}{2^{11}} \Rightarrow 2^{16}$.

$\Rightarrow$ page size $= \frac{2^{27}}{2^{13}} = 2^{14}$

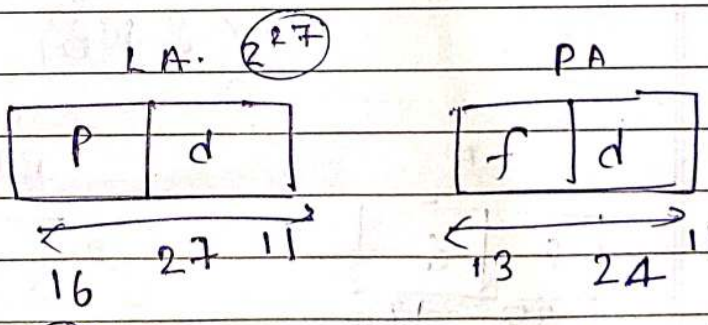
LAS = 128 MW

$= 2^{27} w$

PA = 24 bits

PAS = $2^{24} w$

No. of



2^{16} – Pags

8K = 2^{13} frame

Q. Consider a system which has LA = 32 bits, and PAS = 64 MB, Page size = 4 KB, Memory is Byte addressable. What is approximate size of page table in Bytes.

LA = 32 bits

LAS = 2^{32} Byte

no. of pages = $\frac{2^{32}}{\text{Page size}} = \frac{2^{32}}{2^{12}} = 2^{20}$

~~Page table = 2^{20} x~~

$\Rightarrow 2^{32}$

no. of Frame = $\frac{\text{PAS}}{\text{Page size}} = \frac{2^6 \times 2^{20}\ B}{2^{12}}$

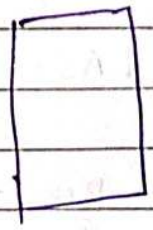
$\Rightarrow 2^{26-12} = 2^{14}\ B$

$= 14$ bit

Page Table = $2^{20} \times 14$-bit

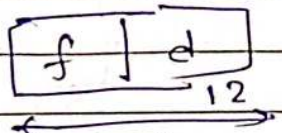
$\Rightarrow 2^{20} \times 2B$

$\Rightarrow$ 2 MB



LA

PA



PAS = 64 MB

$= 2^{26} B$

no. of pages = 2^{20}

$\Rightarrow$ PTE = 14 bits

$= 2B$

Page Table Size = $2^{20} \times 2B$

$= 2$ MB

Date / /
Page

Q. Consider a system, which has, page table with 4K entries, and LA = 29 bits, what is PA if the system has 512 frames.

Page table Entry size = 2^{12} = no. of pages

LA = 29 bits, LAS = 2^{29} B.

no. of frames = 512

no. of pages = 512.

PA = ?

Page table size = ~~512 x ...~~

$\Rightarrow$ ~~$2^9 \times 2^{17}$~~

$\Rightarrow$ ~~2^{17}~~

~~2^{17}~~ ∴ no. of pages = $\frac{2^{29}}{2^{12}}$

$\therefore 2^{17}$

no. of pages = $\frac{2^{29}}{\text{page size}}$ ~~$2^{17} \times$~~

$\Rightarrow 2^{12} = \frac{2^{29}}{\text{page size}}$

$\Rightarrow$ page size = 2^{17}

$\Rightarrow$ ~~page table size~~ = $2^{17} \times 2^9$

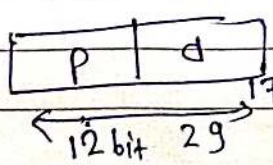
PAS = 2^{26} PA = 26.

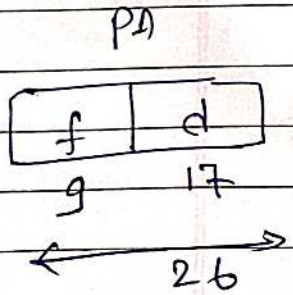
No. of frames = $\frac{\text{PAS}}{\text{frame size}}$

$\Rightarrow 2^9 \times 2^{17}$ PAS

$\Rightarrow 2^{26}$ = PAS

$\Rightarrow$ PA = 26



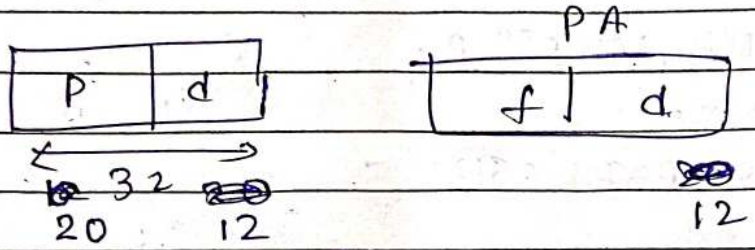


Q. LA = 32 bits

Page size = 4 KB

Page table Entry size = 4 B

Calculate Page table size.

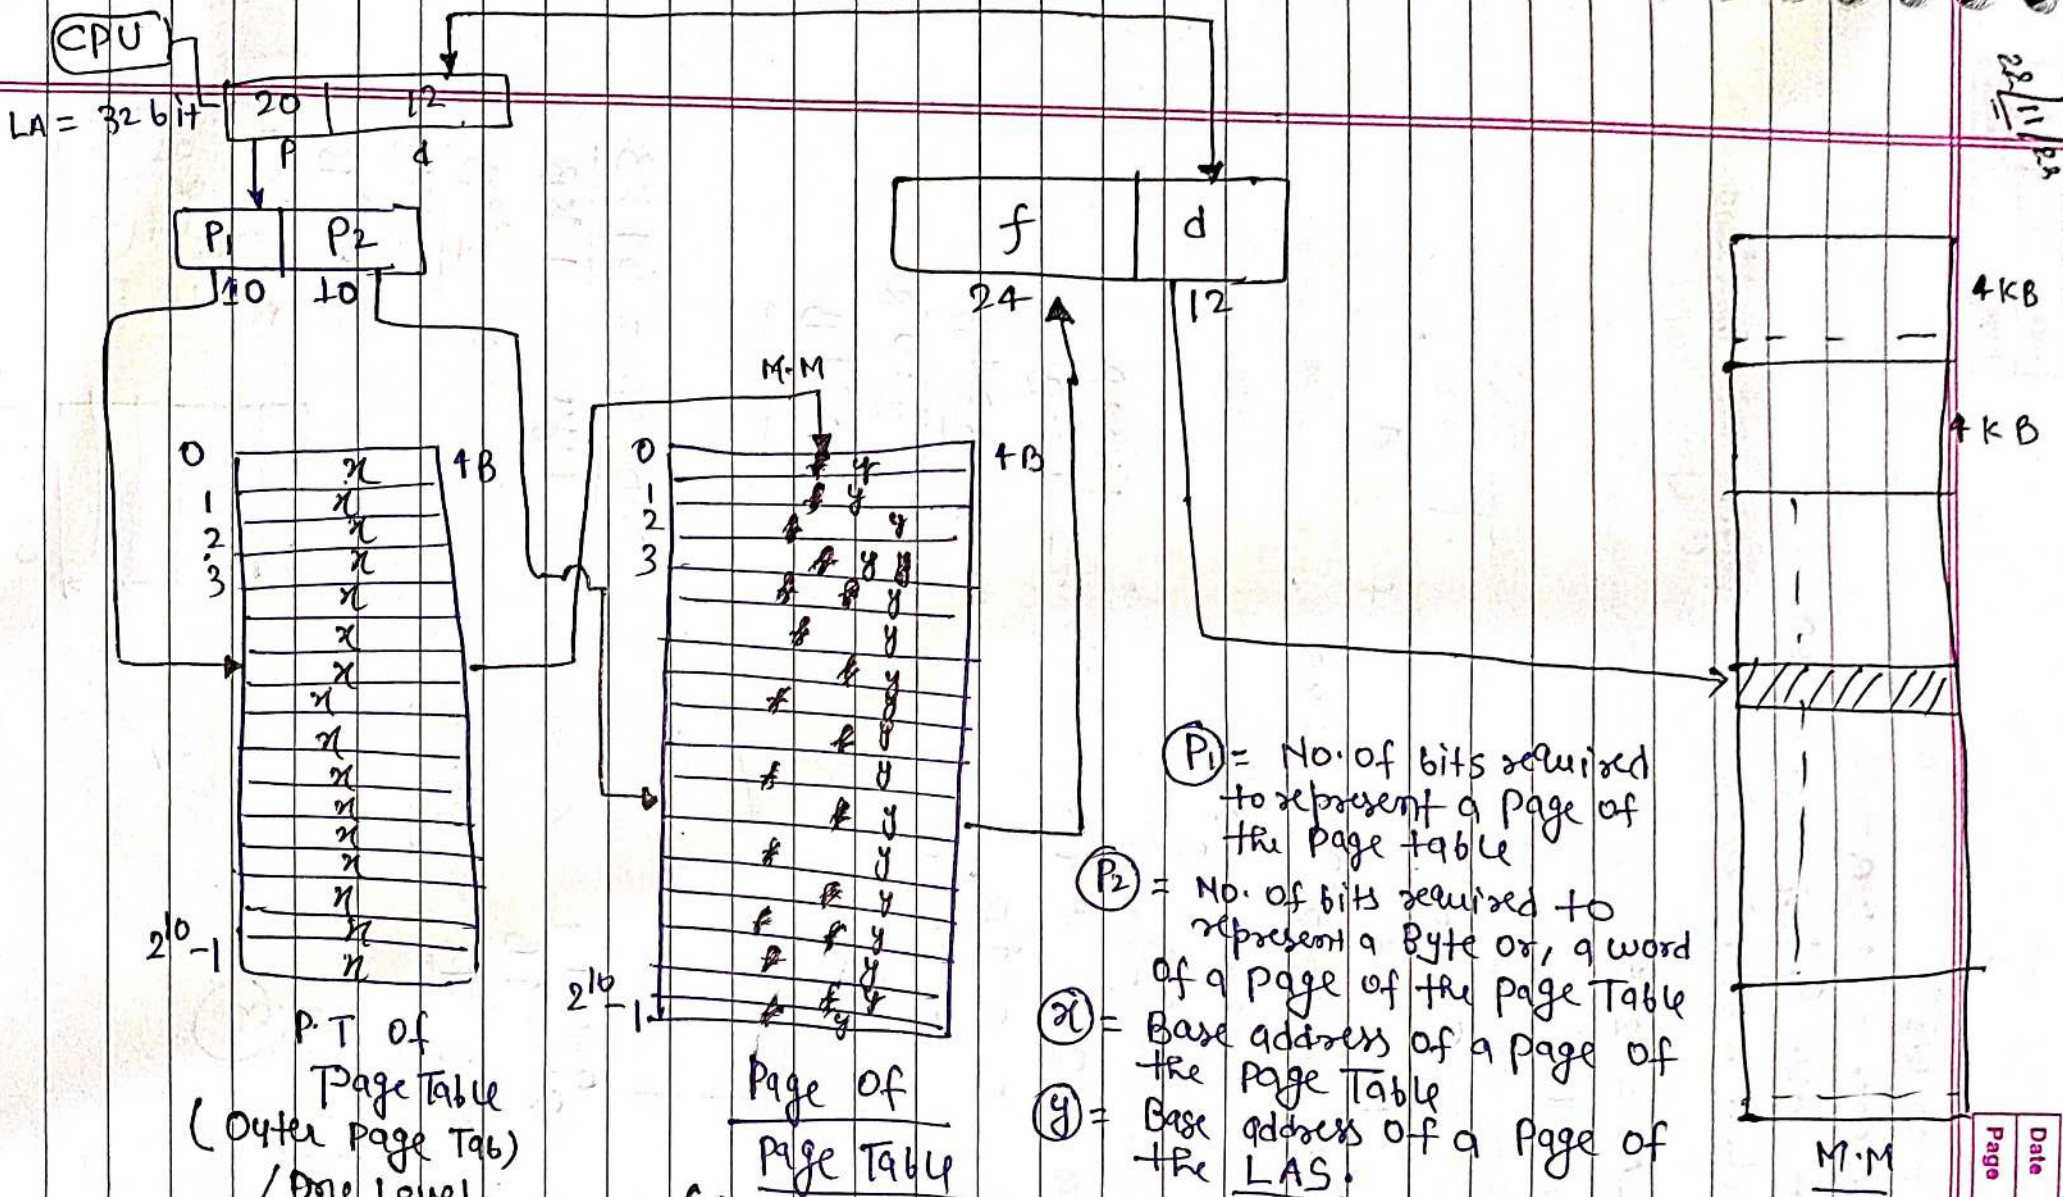


Page size = 2^{12} 4 B

$\Rightarrow$ 2^{20} X 4 B

$\Rightarrow$ (4 MB) $\Rightarrow$ Page table Size

→ Paging completely removes, External fragmentation.. but Paging does not completely removes ~~Exter~~ internal fragmentation, because, the last page of the program may not be equal to the size of page.



(P1) = No. of bits required to represent a Page of the Page table

(P2) = No. of bits required to represent a Byte or, a word of a Page of the Page Table

(x) = Base address of a Page of the Page Table

(y) = Base address of a Page of the LAS.

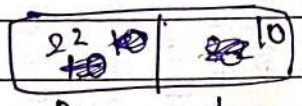
Two Level paging (Multilevel paging)

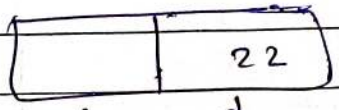
Date / /
Page
RANKA

LA = 32 bit
Page size = 1KB
Page table Entry size = 4B
How many levels of paging will be there.

LAS = 2^{32}

Page size 2^{10}



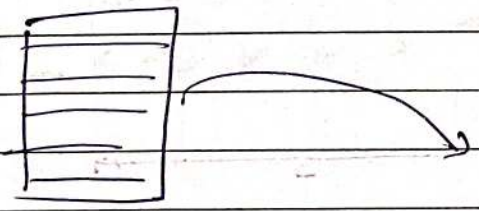


frame size = 2^{10} = 1KB

$\Rightarrow \frac{2^{32}B}{2^{10}B} = 2^{22}$

P. Table Size = $2^{22} * 4B$
$= 2^{24}B$
$= 16MB$

No. of Pages in PT. = $\frac{16MB}{1KB}$
$= \frac{2^{24}B}{2^{10}B}$
$\Rightarrow 2^{14}B$



Outer P.T
$2^{14} \times 4B$

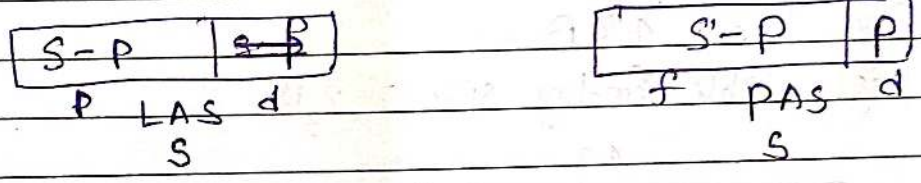
Q: Let LAS = PAS = S Byte

Page size = P Byte

Page Table entry Size = e bytes

what would be the optimal page size so that the memory overhead of maintaining the page table size and the internal fragmentation is minimized?

Assume internal fragmentation = P/2 Byte on an average.



~~No. of Pages~~

internal fragmentation = P/2 Bytes.

$\frac{S}{P}$ (e)

y = PTSize + If.

memory overhead $= \frac{S}{P} * e + \frac{P}{2}$

PTSize, internal fragmentation

$\frac{dy}{dP} = \frac{S}{P} * e + \frac{P}{2}$.

$\Rightarrow S \cdot e \cdot \frac{-1}{P^2} + \frac{1}{2} = 0$

$\Rightarrow \frac{S \cdot e}{P^2} = \frac{1}{2}$

$\Rightarrow P^2 = 2SE$

$\Rightarrow \boxed{P = \sqrt{2SE}}$

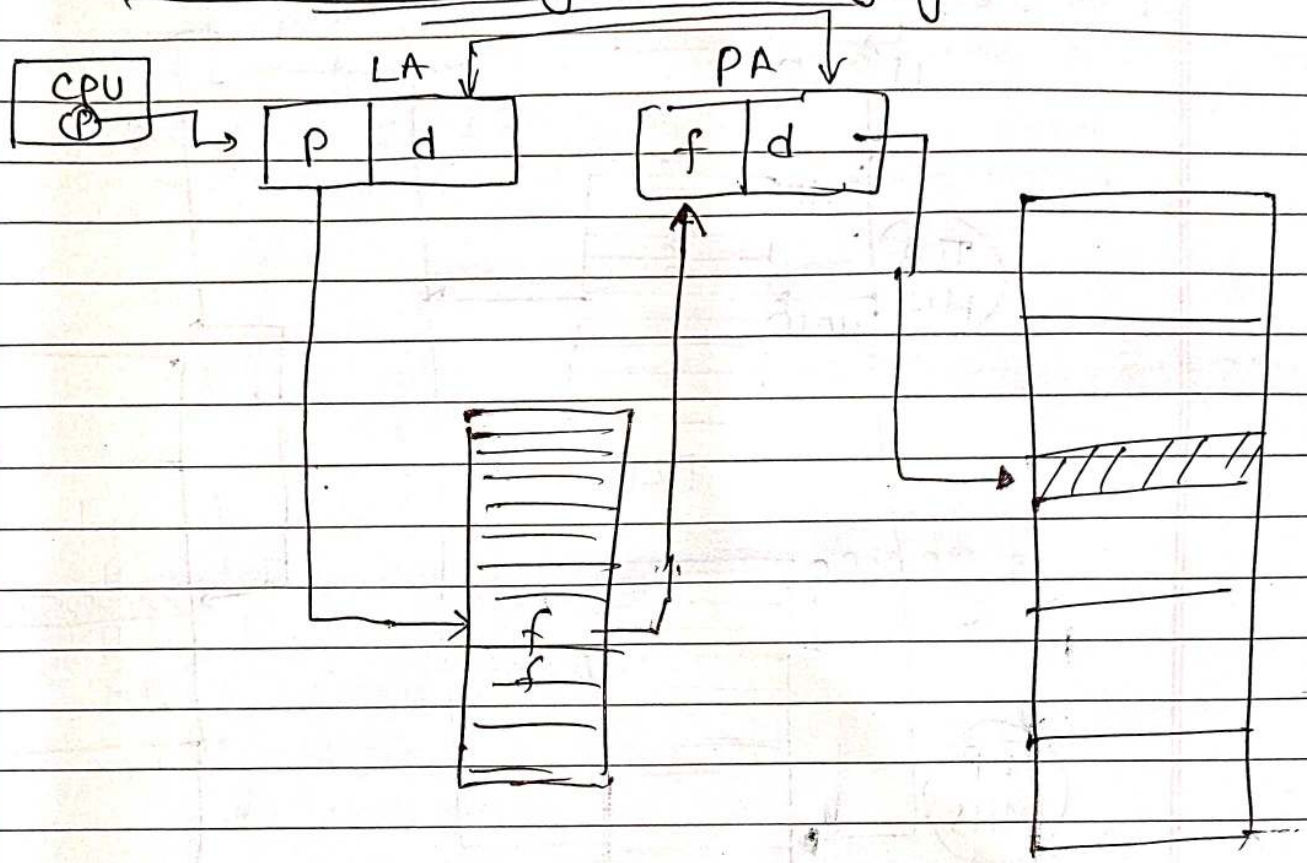
✡ Performance of Single Level paging →



Let m = main memory access time

Effective Memory Access time = 2 * m
(EMAT)

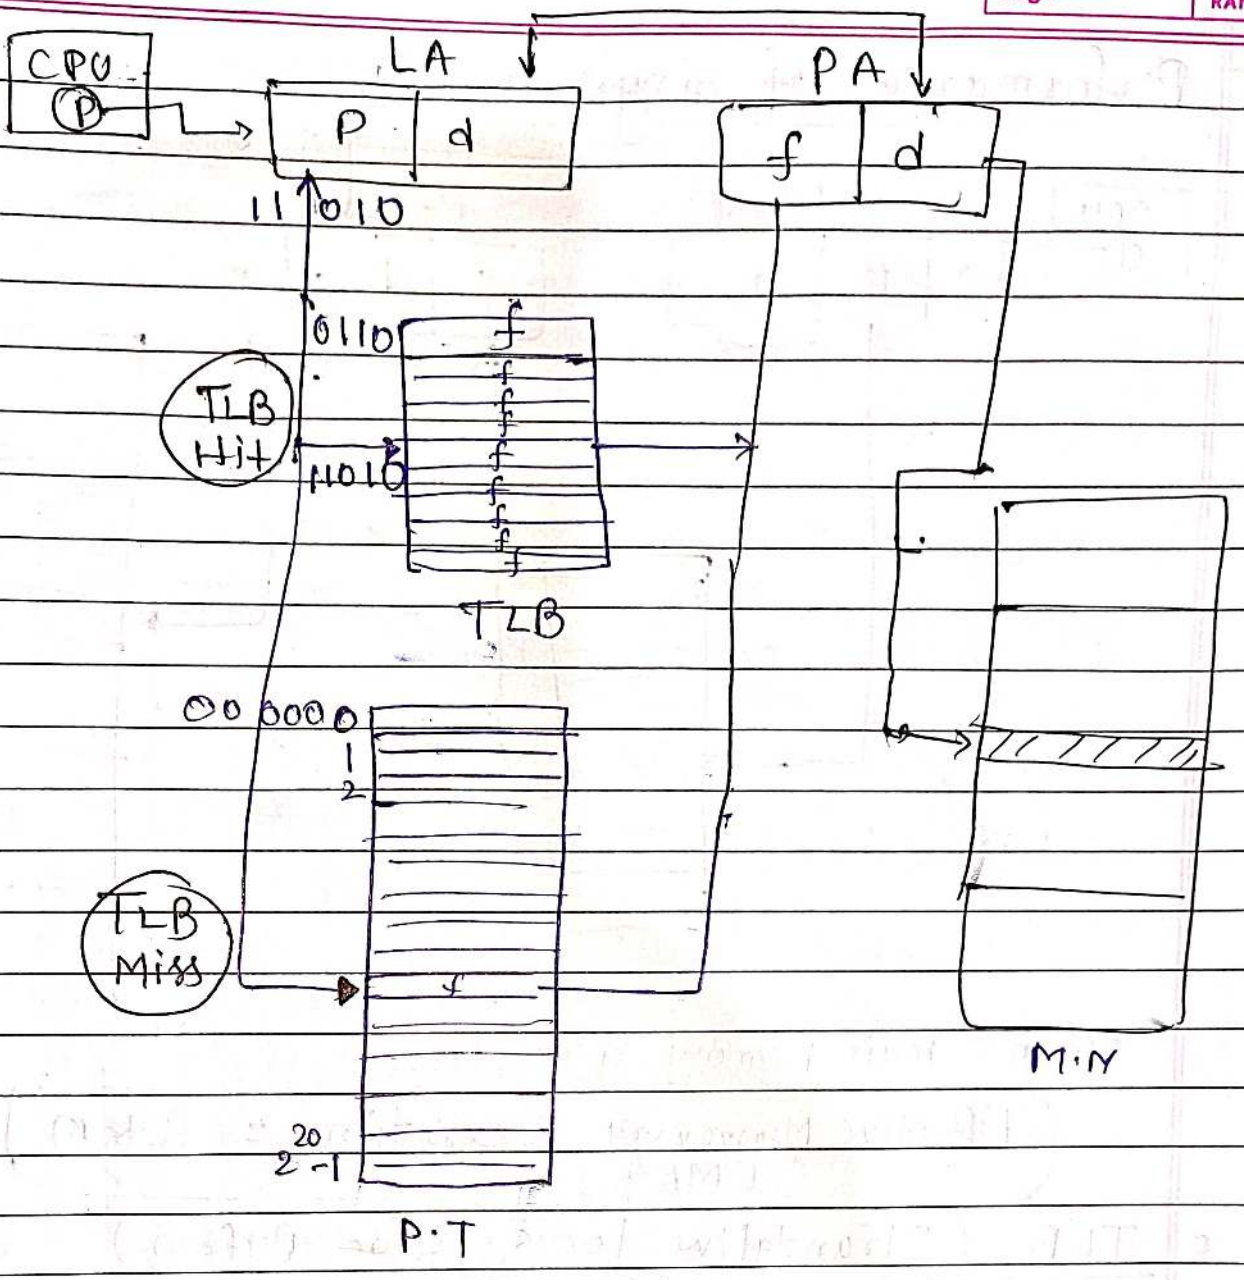
- **TLB** (Translative look-aside Buffer)

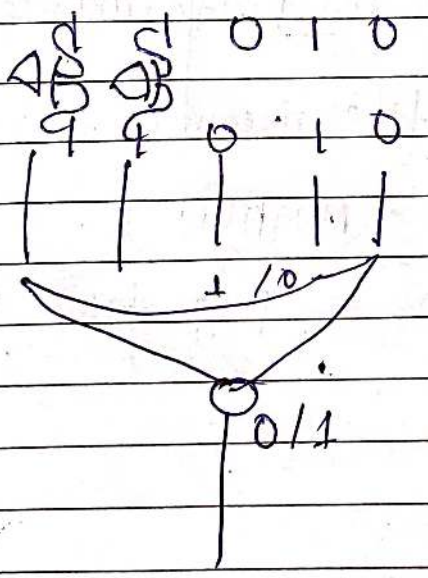
→ TLB is added to improve the performance of paging

→ It is one type of Associative memory.

Cache ⇌ Main memory
TLB ⇌ Page table } Relation

→ Most frequently used pages of the page table are kept in TLB.





Let m = MMAT

C = TLB accesstime

α = TLB hit ratio

EMAT =

$\Rightarrow \alpha(C+m) + (1-\alpha)(C+m+m)$

$\Rightarrow \alpha(C+m) + (1-\alpha)(C+2m)$

Date / /
Page

Q. Consider a system, where MMAT = 100 ns = m
TLB access Time = 20 ns = c
TLB Hit rate = 95 % = x
what is EMAT with TLB, and without TLB.

with TLB

$$EMAT = \frac{95}{100}(0.20*100) + (1-0.95)(20+200)$$

$$\Rightarrow 0.95(120) + (0.05)(220)$$

$$\Rightarrow \frac{0.95 \times 120}{100} + \frac{5}{100} \times 220 \Rightarrow 114 + 11$$

$$\Rightarrow 125 \text{ ns}$$

EMAT without TLB
= 2m
= 200 ns

Q. what hit ratio is required, to reduce EMAT, from 300 ns, without TLB, to 250 ns with TLB.
TLB access Time = 60 ns.

$300 = 2m$
$\Rightarrow m = 150$

$$250 = x(60+150) + (1-x)(60+300)$$

$$\Rightarrow 210x + 210 = 210x$$

$$\Rightarrow 210x + 360 - 360x$$

$$\Rightarrow -150x + 360$$

$$\Rightarrow 250 - 360 = -150x$$

$$\Rightarrow -110 = -150x$$

$$\Rightarrow x = \frac{11}{15}$$

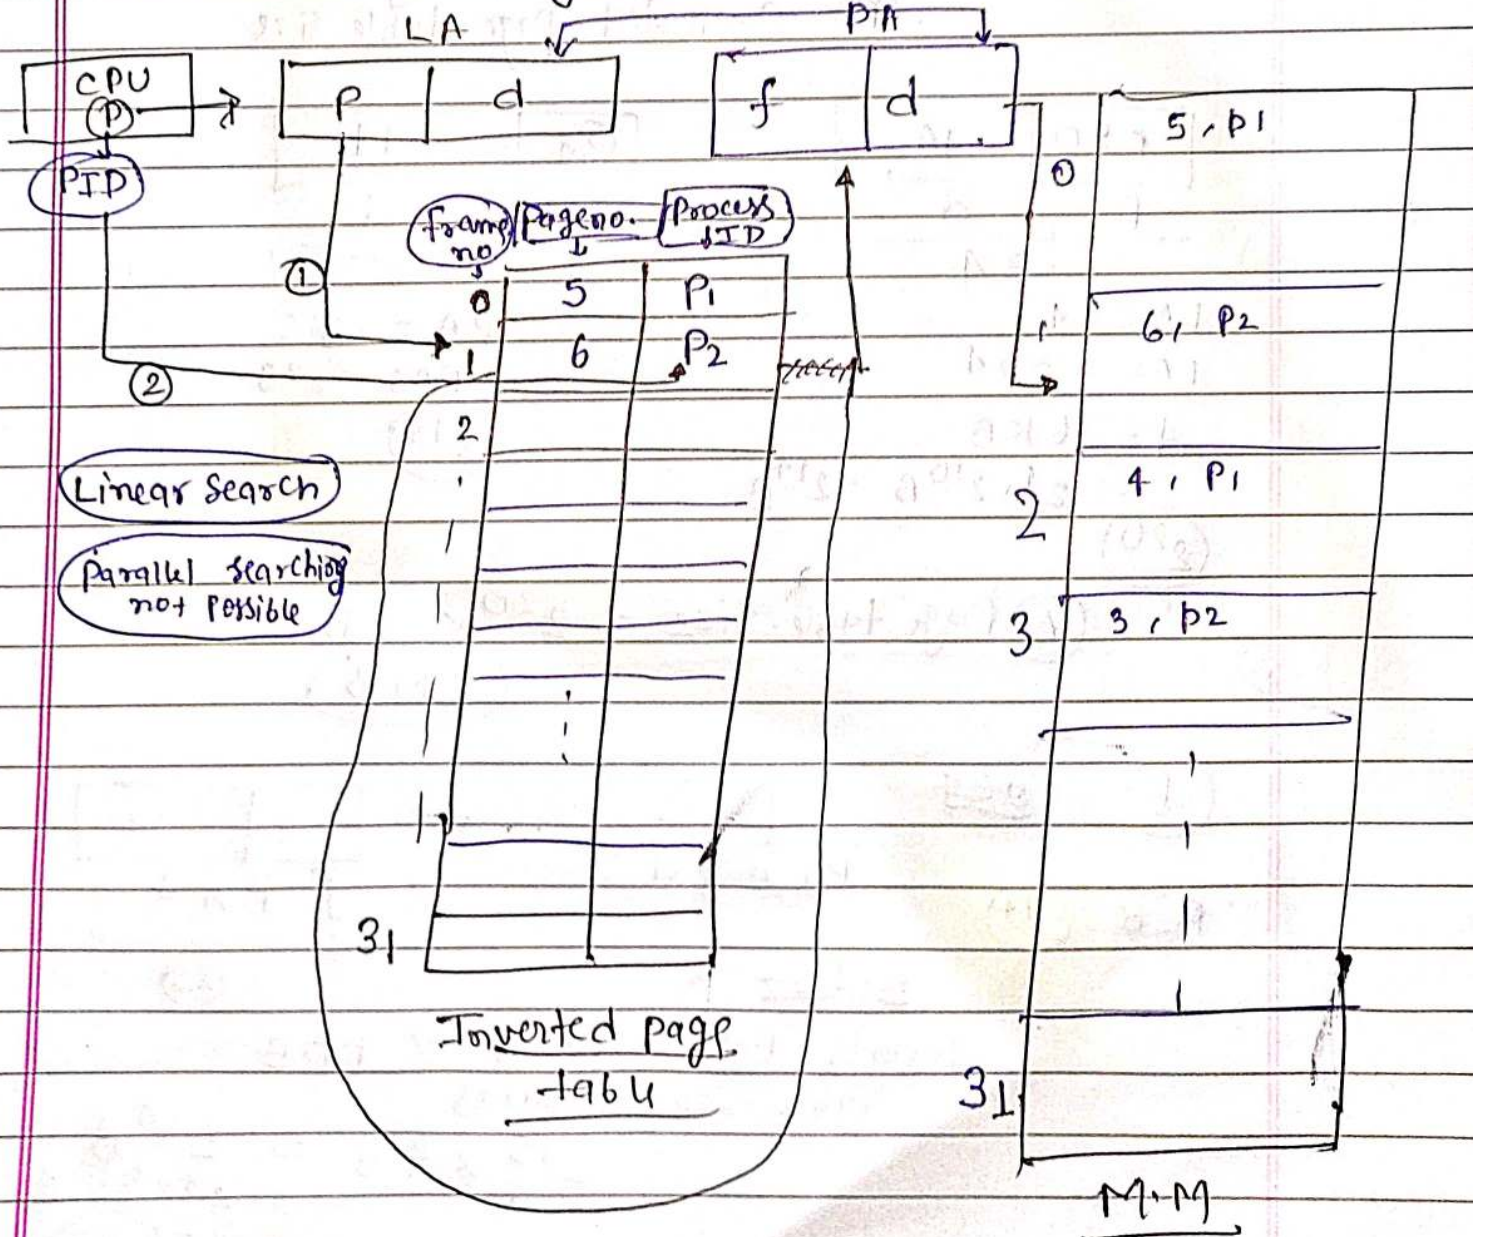
Inverted Paging →

→ Disadvantage of Multilevel
↳ Many page tables are required

→ There will be only one page table, and this page table will be shared by all the processes.

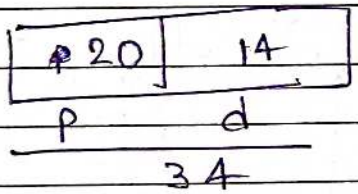


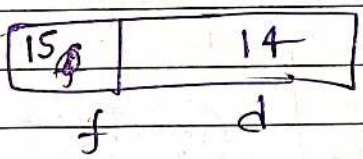
→ The no. of Entries in the Inverted page table will be equal to no. of frames in M.M.

→ **Linear Search** is the disadvantage of Inverted Paging

Q: Consider a System
LA = 34 bit
PA = 29 bit
Page size = 16 KB
Page table Entry Size = 8 B

Calculate no. –
(A) – Conventional page table size
(B) Inverted page table size



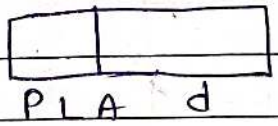


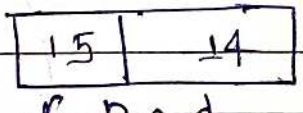
LA = 34
LAS = 2^{34}
d = 16 KB
⇒ $2^4 \times 2^{10}$ B = 2^{14} B
2^{20}

PA = 29
PAS = 2^{29}
2^{15}

(A) Page table size = $2^{20} \times 8$ B
⇒ 8 MB

(B)





d = 2^{14}

29

Inverted Page Table Size = No. of frames × PT.E.
= $2^{15} \times 8$ B ⇒ 2^{18} B
⇒ $2^8 \times 2^{10}$ B
= 256 KB
